TECHNICAL DOSSIER

Title of the project	Back is Front- Inversion of Alexandria
Authors	Xiaosong Ma, Ruokun Zhang, Dongchen Li, Ying Zhang, Chao Xu
Title of the course	Seminars of Landscape Architecture Design
Academic year	2017-2018
Teaching Staff	Liu Xiaoming, Zhu Jianning, Cui Liu
Department/Section/Program of belonging	School of Landscape Architecture Landscape Architecture Program
University/School	Beijing Forestry University

Written statement, short description of the project in English, no more than 250 words

Alexandria, the second biggest city in Egypt, has thrived by harbor. Built on the T-shaped Nile delta, the edge of the Sahara, Alexandria situates on a land strip caught between the sea and lagoons. Nowadays, she is an industrialized tourist city threatened by both natural and social problems including marine submersion, sandstorms, industrial pollutions, population expansion, deterioration of slums, and historical context breaks. All of these crises have increased social imbalance, which hampers sustainable development of Alexandria. Imbalance is reflected in all kinds of scales. Most tourist and social resources are distributed along the coastline, while heavy industries, brownfields, informal accommodation, and desertification farmland occupy the side of hinterland.

Although the innate gaps caused by history and geography are neither just nor unjust, we can still create away that enables institutions to deal with the natural facts to pursue justice. The green system plays the role of communication, fusion and guidance contributing to the inversion of city development trend lead to a more justice society.

The Green system integrates natural facts that we can use. It constructs strategies for different types of urban areas respectively, while they are all designed for the inversion of hinterland. As for regional scale, the desert buffer belt combined with local precision agriculture defends against the sandstorm and stabilizes the edge of the delta to guarantee field production. As for urban border areas, the phytoremediation models around informal accommodation provide safe environment and social opportunities. As for the historical block, the strategy extracts spatial pattern of the traditional Egypt Garden, which encloses space by trees at the same time creating height variations to make blend spaces reconciling the requirement of residents and tourists.

SPACE DISTRIBUTION

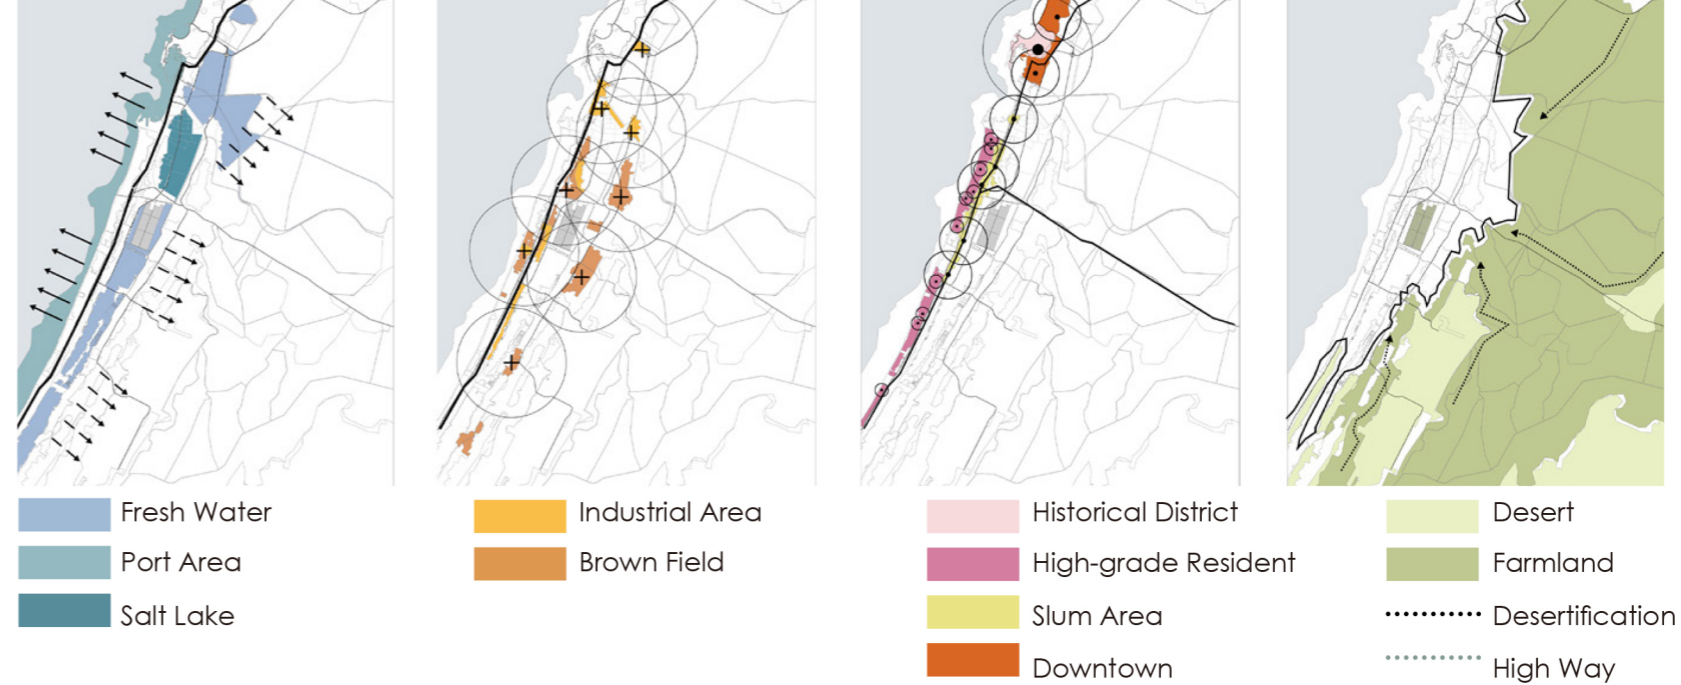

Alexandria is an industrialized tourist city threatened by an increased gap between coastline and hinterland, which is a result of unbalanced resources distribution. Most social resources are distributed along the coastline, while heavy industries, brownfields, informal accommodation, and desertification farmland occupy the side of hinterland. Thus, we manage to fill up the gap by landscape power—windbreak and phytoremediation.

CRISIS CONCERN

- 1) SUBMERSION: Alexandria faces a marine submersion problem, eating the city spaces.
- 2) DESERTIZATION: Back area of Alexandria is suffered from oasis marginal land desertization.
- 3) POLLUTION: Polluted and toxic brown fields encompass the slums in the back area, which makes poor people struggled with life.

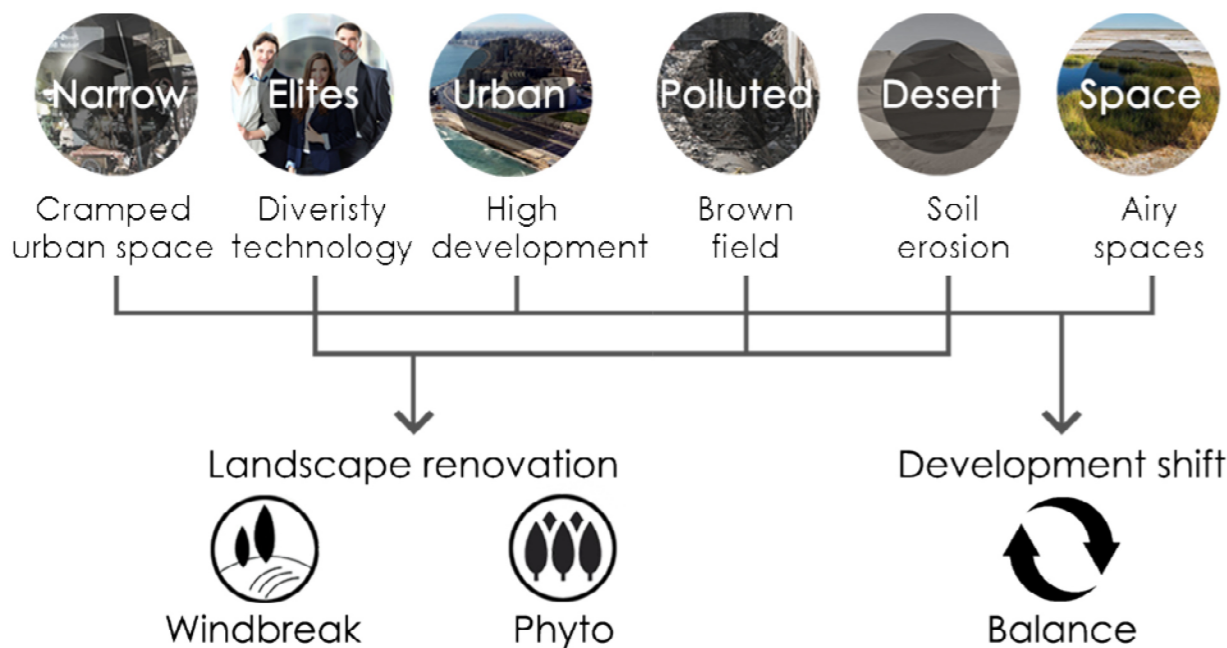

AREA ANALYSIS

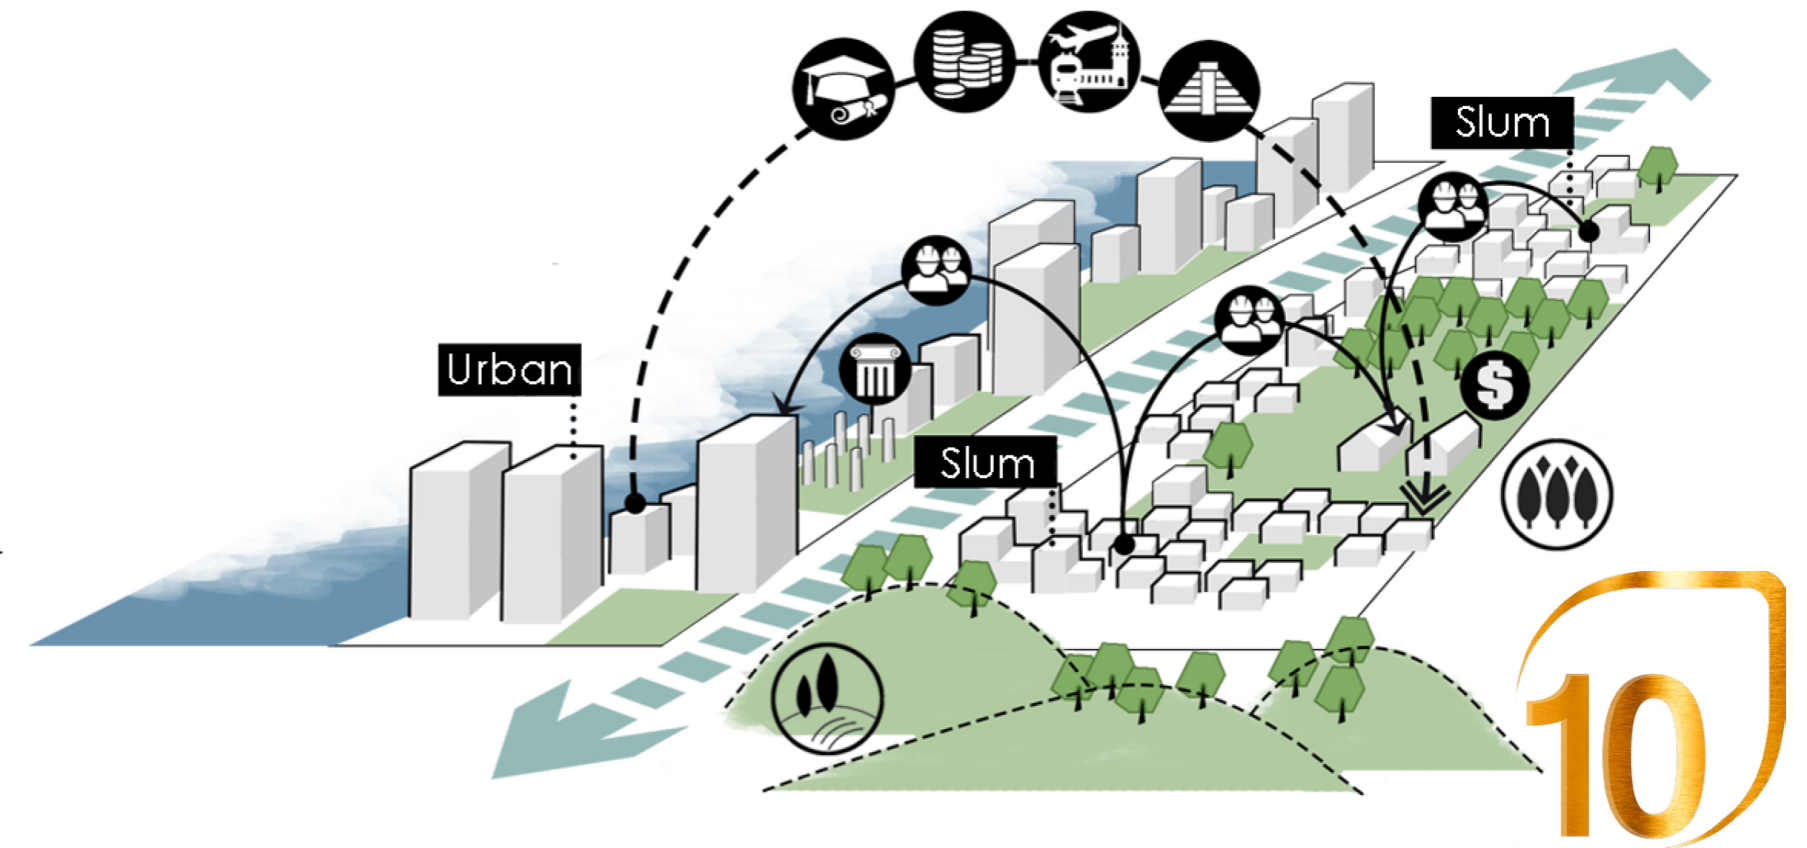

THINKING PROCESS

FRONT AREA

BACK AREA

STRATEGY

RELATIONSHIP BETWEEN FRONT AND BACK AREA

Population Slums around by extensive brown field are fillwithed by people. Meanwhile, farmlands face a serious desertification crisis.

Housing

Space Distribution Brown Field Green Space

2017

Population Comfortable space for people to live is going to expend more. Windbreak will slow down the desertification, and Phyto skills will renovate brown fields.

Housing

Space Distribution Brown Field Green Space

2030

Population Eventually, with more space to develop, Alexandria will shift her development from the front area to the back.

Space Distribution Brown Field Green Space

2060

WINDBREAK DEVELOPMENT

TERRIANV

PRESENT
Desertification is increasingly destroying the oasis by strong wind.

PHASE 1
By heaping up terrain and planting vegetation, wind will be broken.

PHASE 2
Wind will bring sands and pile them up.

PHASE 3
the new terrain formation reduces the desertification.

ENVIRONMENT

PRESENT
Hot air, from both desert and urban, causes a dry climate.

PHASE 1
Hot air from the desert will be cold after through the wind break terrian.

PHASE 2
Drought will be reduced after the collision of hot and cold air.

PHASE 3
More moist climate will increase the vegetation.
